Encoder: learned on D only
Decoder: uses D, embeddings and G
1. Random walks
follow the arcs of D
walk = sentence
hub sub-sampling
2. Skip-Gram
structural negatives
(non-successors in D)
$\rightarrow \mathbf{V}_{in}, \mathbf{V}_{out}$
3. Guided decoding
lookahead lf(v)
+ embedding similarity
+ G-connectivity bonus
4. Exact extraction
longest sub-path
connected in G
(Union-Find)
